予 想 問 題　第 2 回

前 期 日 程　対 策

英 語 問 題

大阪大学（外国語学部以外）の出題形式に準拠 ／ 問題

注　意

1. 問題部分と解答用紙で構成されている（問題部分 1〜7ページ・解答用紙 8〜9ページ）。答えは解答用紙の決められた欄に書くこと。
2. 試験時間の目安は90分（文学部の志願者は105分）。大問は I〜IV の4題。
3. IV(B)は，**文学部志望なら(イ)**，**それ以外の学部志望なら(ロ)**に答えること。
4. 配点は I 30点・II 50点・III 30点・IV 40点（計150点）。本予想問題が独自に定めた配点である。
5. 本冊子の英文・日本文・設問はすべてオリジナルである。

大阪大学の過去問・公式問題ではありません。予想問題であり，大学とは関係がありません。
本冊子は過去の出題形式を分析して作成した練習用の教材です。

I 英文和訳（配点 30点）

英文(A)・(B)の下線部を，それぞれ和訳しなさい。

(A) Most of us are surprisingly poor at estimating how long a task will take. We picture the work proceeding smoothly from beginning to end and overlook the interruptions, mistakes, and small delays that have slowed us down before. What makes this tendency so persistent is that experience rarely corrects it: having finished a project late, we tend to blame the particular problems that arose rather than recognizing that some such problems almost always arise. A more reliable approach is to ask not how long this task ought to take, but how long similar tasks have actually taken in the past.

(B) An object on display in a museum is never quite the same object it was before. A bowl that was once used every day to serve rice now sits behind glass, lit from above, with a small label giving its date and place of origin. Removed from the hands that held it and the meals it was part of, it invites us to look rather than to use, and in doing so it acquires a kind of beauty that its makers may never have noticed. Whether this is a gain or a loss depends on what we believe objects are for.

II 長文読解（配点 50点）

英文を読み，後の設問(1)〜(6)に答えなさい。

Science Beyond the Laboratory

When astronomers wanted to sort an enormous collection of images of distant galaxies by shape, they faced a problem that the computers of the time could not solve well and that no team of professionals could finish within a reasonable period. Their solution was to ask the public for help. It worked. Volunteers with no scientific training were shown a few examples, given simple instructions, and invited to classify images through a website. Within a short time, they had made a vast number of judgments, and their combined answers proved remarkably reliable. This episode is often cited as a turning point for what has come to be called citizen science: research in which members of the public take part in collecting or analyzing data.

In one sense, there is nothing new about this. Long before science became a profession, much of what was known about plants, birds, and weather was gathered by amateurs. Among them were clergymen who kept diaries of the first frost, farmers who jotted down when the swallows returned, naturalists and hobbyists who pressed flowers between the pages of books and kept careful tallies of what they found. (1)What has changed is the scale at which ordinary people can now contribute. Smartphones equipped with cameras and satellite positioning allow anyone to record exactly what they see and where, while the internet allows such observations from thousands of places to be collated at once.

The advantages for researchers are obvious. Many natural phenomena are too widespread, too rare, or too (i)fleeting to be monitored by a small team of specialists. A sudden bloom of algae in a lake, the arrival of an invasive insect, or the shifting range of a butterfly as the climate warms may be noticed first by someone who happens to live nearby. By recruiting such observers, scientists can gather data over areas and periods that would otherwise lie far beyond their budgets. In some fields, volunteers have even made discoveries in their own right, spotting patterns that professionals had overlooked.

Yet the approach has also met with skepticism. Critics worry that data collected by untrained volunteers are bound to be unreliable. One person may misidentify a species; another may report only the unusual birds that excite them and ignore the common ones; a third may simply make a typing error, and every observer has quirks and idiosyncrasies of their own. (A)Such concerns are not unfounded, but they are rarely as damaging as they first appear. Yet the records can be scrutinized. Well-designed projects build in ways to detect and correct mistakes: several volunteers may classify the same image independently, photographs may be required as evidence, and statistical methods can adjust for the tendency of observers to search harder in

some places than in others. In practice, the (ii)sheer quantity of observations often compensates for flaws in individual records.

Citizen science also raises questions that go beyond accuracy. Who owns the data that volunteers produce, and who receives credit when the data lead to a publication? Projects have sometimes been criticized for (B)treating participants merely as unpaid labor, asking them to perform tedious and laborious tasks while keeping every decision about research questions firmly in the hands of professionals. In response, some researchers have begun to involve communities from the outset, inviting them to help decide what should be studied. A town worried about pollution in its river, for example, may work with scientists to design a monitoring program that addresses the questions residents themselves consider urgent.

Advocates argue that the benefits extend to the participants as well. (2)People who spend a season counting the insects that visit their garden are unlikely ever to look at it in quite the same way again, for they have learned to notice what was always there but never seen. Taking part in research can sharpen observation, deepen an understanding of how evidence is gathered, and make abstract issues such as the loss of biodiversity* feel concrete and personal. It may also (iii)bolster public trust in science at a time when that trust cannot be taken for granted. Someone who has seen how carefully data must be checked before conclusions are drawn may be less inclined to dismiss scientific findings as mere opinion, and more inclined to ask how a claim was tested.

None of this means that amateurs can replace professionals, and few supporters of citizen science would claim so. (3)The relationship works best when each side contributes what it does best. Professionals bring training, equipment, and expertise in designing studies and interpreting results; volunteers bring numbers, local knowledge, and an attentiveness to places that researchers may visit only rarely. When the arrangement is (iv)equitable, both parties gain something they could not easily obtain alone.

(C)Perhaps the most important contribution of citizen science is to blur the boundary between those who produce knowledge and those who merely receive it. For much of the past century, science was something done by experts in laboratories and reported to the public afterward. Citizen science suggests a different picture, in which curiosity and careful observation are not the property of a profession but capacities that almost anyone can (v)cultivate, given a little guidance and a reason to look closely.

注　biodiversity　生物多様性

設問(1)　下線部(i)〜(v)の語がこの文章で表している意味として，最もふさわしいものを(イ)〜(ニ)からそれぞれ1つ選び，記号で答えなさい。

(i) fleeting

(イ) frequent　(ロ) enormous　(ハ) short-lived　(ニ) distant

(ii) sheer

(イ) very great　(ロ) steep　(ハ) see-through　(ニ) occasional

(iii) bolster

(イ) weaken　(ロ) measure　(ハ) replace　(ニ) strengthen

(iv) equitable

(イ) profitable　(ロ) fair　(ハ) temporary　(ニ) formal

(v) cultivate

(イ) inherit　(ロ) abandon　(ハ) develop　(ニ) purchase

設問(2)　下線部(A)〜(C)について英語で問う。それぞれの問いに対する答えとしてふさわしいものを(イ)〜(ニ)から1つずつ選び，記号で答えなさい。

(A) Such concerns are not unfounded, but they are rarely as damaging as they first appear.

What is the author's view of the concerns about accuracy?

(イ) They are groundless, because volunteers seldom make mistakes.
(ロ) They are so serious that most volunteer data cannot be used.
(ハ) They apply only to projects that ask volunteers to take photographs.
(ニ) They have some basis, but careful design and large numbers of records can largely overcome them.

(B) treating participants merely as unpaid labor

Why have some projects been criticized in this way?

(イ) Volunteers were given dull work but no say in what the research should investigate.
(ロ) Volunteers were paid less than professional researchers for the same work.
(ハ) Volunteers were not allowed to see the data that they had collected.
(ニ) Volunteers were asked to design studies without any training.

(C) Perhaps the most important contribution of citizen science is to blur the boundary between those who produce knowledge and those who merely receive it.

What does the author mean by this?

(イ) Citizen science leaves people unable to tell reliable knowledge from opinion.
(ロ) Citizen science shows that creating knowledge need not be limited to professional experts.
(ハ) Citizen science allows the public to receive scientific news more quickly.
(ニ) Citizen science will soon replace research carried out in laboratories.

設問(3)　下線部(1)のように言えるのはなぜか。第2段落に基づいて45字以内でまとめなさい（句読点も1字と数える）。

設問(4)　下線部(2)を，内容がよく伝わるように和訳しなさい。

設問(5)　下線部(3) The relationship works best when each side contributes what it does best. とはどういうことか。両者がそれぞれ何を提供するかを明らかにして，英語40〜50語程度でまとめなさい。

設問(6)　本文の内容に一致するものを(イ)〜(ヘ)の中から2つ選んで，その記号を書きなさい（順序は問わない）。

（イ）銀河の画像の分類では，専門家が一般の人の判断をすべて点検し直す必要があった。
（ロ）科学が職業になる以前から，植物や鳥，天候についての知識の多くは愛好家によって集められていた。
（ハ）批判する人によれば，ボランティアは珍しい鳥よりもありふれた鳥ばかりを報告しがちである。
（ニ）筆者は，市民科学によってやがて専門の研究者は不要になると考えている。
（ホ）研究の初めの段階から地域の人々を参加させ，何を調べるかを一緒に決める研究者もいる。
（ヘ）市民科学に参加しても，科学への信頼が高まることはないと筆者は述べている。

III　自由英作文（配点 30点）

高校で使う教科書を，紙の本からタブレット端末で読むデジタル版にすべて切り替えるべきだという意見があります。この意見に賛成か反対かを明らかにし，その理由を1つに絞って，自分なりの具体例を挙げながら英語80語程度で述べなさい。

IV　和文英訳（配点 40点）

日本文(A)・(B)の下線部を英訳しなさい。(B)は，文学部を志望する人は(イ)，それ以外の学部を志望する人は(ロ)に答えること（本予想問題では，志望と異なる側を選んだ答案は採点しない扱いとする）。

(A)（全員）

会話が途切れて沈黙が続くと，多くの人は気まずさを感じ，何か話題を探そうとする。けれども，相手の言葉を聞いてすぐに答えを返すことだけが，よい聞き手の条件ではない。少し黙って考えてから口を開く人のほうが，相手の話を本気で受け止めているように感じられることも多い。沈黙は会話の失敗ではなく，ことばが熟すのを待つための時間なのである。

(B)

(イ)（文学部志望）

古本屋で買った文庫本のページをめくっていると，余白に鉛筆で小さな書き込みが残っていることがある。見知らぬ前の持ち主が，どの一文に心を動かされ，どこで首をかしげたのかを想像しながら読み進めると，一冊の本を二人で読んでいるような不思議な気分になる。新しい本では決して味わえない，こうしたささやかな出会いこそ，古本を手に取る楽しみなのだと思う。

(ロ)（文学部以外の学部志望）

ある集団の特徴を一つの数で表そうとするとき，私たちはつい平均値に頼りがちである。しかし，ごく一部に極端に大きな値が含まれていると，平均値は大多数の実態からかけ離れたものになってしまう。たとえば住民の収入を比べる場合には，全員を順に並べたときにちょうど真ん中に来る人の値を見るほうが，典型的な暮らしぶりをよく表していることが多い。

解答用紙　予想問題 第2回

受験番号・氏名欄は省略。記号は (イ) のように書く。

I

(A)

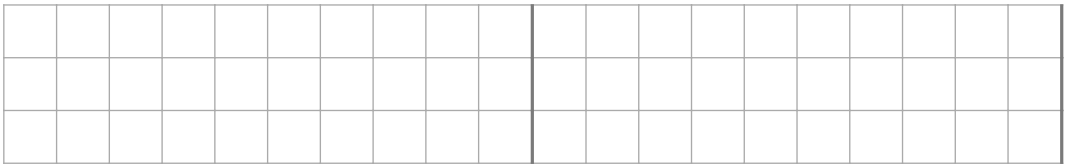

(B)

II

設問(1)　(i) [　　]　(ii) [　　]　(iii) [　　]　(iv) [　　]　(v) [　　]

設問(2)　(A) [　　]　(B) [　　]　(C) [　　]

設問(3)

45字（20字×3行，10字ごとに太線）

設問(4)

20語

設問(5)

40語

設問(6)　[　　]　[　　]

解答用紙（III・IV）

III（80語程度）

20語

40語

60語

80語

100語
